

THREE PANEL SIZES, INCREDIBLE PROFILE DETAIL

Panocell-20 has an antigenic profile so detailed that you can distinguish between an anti-C and an anti-D or identify antibodies exhibiting dosage.

Panocell-16 is another ideal choice for standard identification of single or multiple antibodies.

Panocell-10 is a cost-effective first pass, identifying single antibodies or flagging samples that require further investigation.

The antigen profiles of all reagent red blood cell donors used to manufacture Immucor Gamma's antibody identification panels are phenotyped with red cells and genotyped with BioArray HEA BeadChip technology.

Extended antigen typing by DNA analysis includes 38 antigens and phenotypic variants.

Each lot of Immucor Gamma's extensive line of antibody identification panels will begin to include the genotypes of the regular reagent red blood cell donors listed on the Supplemental Unit Typings (SUT) worksheet.
